Sezione di Zoologia, Università di Firenze
(List updated on 01.05.2021)**

E' riportato l'inventario della collezione Angelini conservata presso il Museo di Storia Naturale, Sezione di Zoologia, dell'Università di Firenze. Si è ritenuto opportuno stilare questo elenco in formato digitale in considerazione della quantità dei dati presenti e al fine di agevolare la ricerca delle specie nelle rispettive scatole entomologiche in cui sono conservate, le quali sono inoltre state fotografate singolarmente. Alla collezione, acquisita nel dicembre 2014 e composta da 1.172 scatole, ne sono state successivamente incorporate ulteriori 73 con materiale aggiuntivo ed indicato sub "Addenda". L'originaria schedatura del dicembre 2014 è stata pertanto aggiornata al 01.05.2021.

Famiglie, generi e specie sono in rispettivo ordine alfabetico. Per le famiglie si è generalmente tenuto conto della nomenclatura proposta nel "Catalogue of Palaeartic Coleoptera", vol.1-8 e in Bouchard et alii, 2011: 1-972. Per uniformità con le preesistenti storiche collezioni del Museo, in alcuni casi non sono stati seguiti i suddetti lavori.

Il nome dei taxa è stato verificato sui volumi del "Catalogue of Palaeartic Coleoptera", vol.1-8 (2003-2020 inclusi gli aggiornamenti ai volumi 1, 2, 3, 5, 6, 7 e 8 (2015-2020) della medesima opera nonché sul sito di Fauna Europaea (www.fauna-eu.org); per le specie extrapaleartiche sono stati consultati prevalentemente i seguenti siti internet: "Index to Organism Names" (www.organismnames.com), "Encyclopedia of Life" (<http://eol.org>), "Global Names Index" (<http://gni.globalnames.org>), "Integrated Taxonomic Information System" (www.itis.gov), "Nearctica" (<http://www.nearctica.com>) e, per i Carabidae, anche il sito "Carabidae of the World" (<http://carabidae.org>). In numerosi casi sono altresì state consultate specifiche monografie, revisioni e volumi del Catalogus Junk per la fauna Afrotropicale, Neotropicale, Orientale ed Australiana.

In rare occasioni non è stato possibile risalire al nome corretto della specie, al suo Autore o anno di descrizione, in questi casi il nome del taxon è seguito dal simbolo "(=?)"; è stato appurato che spesso trattasi di erronea trascrizione del nome o sua attribuzione generica al momento dell'acquisizione della specie in collezione.

Le 5 colonne in cui è suddiviso il testo riportano, nell'ordine: nome del taxon, numero di esemplari, nazione/i di provenienza, numero paratipi, numero della scatola ove è conservato.

La collezione, ad oggi, comprende in totale 492.824 esemplari. Di questi 441.565 risultano determinati mentre 51.259 rimangono non identificati. Il materiale determinato, almeno a livello di genere, consiste di 37.435 specie e comprende:

- Holotypi: 5 specie
- Paratipi: 360 specie per un totale di 2.307 esemplari
- Le Nazioni la cui coleotterofauna è maggiormente rappresentata sono: l'Italia con 8.594 specie, Stati Uniti con 2.889, Grecia 2.743, Turchia 2.472, Argentina 1.969, Spagna 1.485, Cile 1.338, Russia 1.180, Marocco 1.141, Tunisia con 940, Giappone 869 e Rep. Sudafricana con 660 specie.

Al termine dell'inventario della collezione viene altresì riportato l'elenco del materiale tipico, nel quale gli holotypi sono contrassegnati da un "*".
